

LAB EXPERIMENTS: Topic 1

Experiment 1: First Palindromic String in an Array

Aim

To write a program to find the first palindromic string in a given array of strings.

Algorithm

1. Start.
2. Read the list of strings.
3. Traverse each string in the list.
4. Check whether the string is equal to its reverse.
5. If a palindrome is found, print it and stop.
6. If no palindrome exists, print an empty string.
7. Stop.

Pseudocode

BEGIN

Initialize words = ["abc", "car", "ada", "racecar", "cool"]

FOR each word in words **DO**

IF word = reverse(word) **THEN**

PRINT word

STOP

END IF

END FOR

PRINT ""

END

<pre>main.py 1- def first_palindrome(words): 2- for word in words: 3- if word == word[::-1]: 4- return word 5- return "" 6 7 # Input as an array 8 words = ["abc", "car", "ada", "racecar", "cool"] 9 10 print(first_palindrome(words))</pre>	Run Output Clear <pre>ada === Code Execution Successful ===</pre>
---	--

Sample Input

abc car ada racecar cool

Sample Output

ada

Time Complexity

$O(n \times m)$

where

- n = number of strings
- m = average length of a string

Space Complexity

$O(1)$

Result

Thus, the program was executed successfully and the first palindromic string was displayed.

Experiment 2: Count Common Elements Between Two Arrays

Aim

To write a program to count how many elements of one array exist in another array.

Algorithm

1. Start.
2. Read two integer arrays.
3. Convert both arrays into sets.
4. Count elements of the first array present in the second set.
5. Count elements of the second array present in the first set.
6. Print both counts.
7. Stop.

Pseudocode

BEGIN

Read nums1

Read nums2

answer1 $\leftarrow$ 0

answer2 $\leftarrow$ 0

FOR each element in nums1

IF element exists in nums2

answer1 $\leftarrow$ answer1 + 1

ENDIF

ENDFOR

FOR each element in nums2

IF element exists in nums1

answer2 $\leftarrow$ answer2 + 1

ENDIF

ENDFOR

PRINT answer1, answer2

END

main.py	  	Run	Output	Clear
<pre>1 nums1 = list(map(int, input("Enter first array: ").split())) 2 nums2 = list(map(int, input("Enter second array: ").split())) 3 4 set1 = set(nums1) 5 set2 = set(nums2) 6 7 answer1 = sum(1 for x in nums1 if x in set2) 8 answer2 = sum(1 for x in nums2 if x in set1) 9 10 print([answer1, answer2])</pre>			<pre>Enter first array: 2 3 2 Enter second array: 1 2 [2, 1] === Code Execution Successful ===</pre>	

Sample Input

2 3 2

1 2

Sample Output

[2, 1]

Time Complexity

$O(n + m)$

Space Complexity

$O(n + m)$

Result

Thus, the program was executed successfully and the common element counts were displayed.

Experiment 3: Sum of Squares of Distinct Counts of All Subarrays

Aim

To write a program to calculate the sum of squares of distinct element counts of all subarrays.

Algorithm

1. Start.
2. Read the array.
3. Generate every possible subarray.
4. Count distinct elements using a set.
5. Square the distinct count and add it to the total.
6. Display the total.
7. Stop.

Pseudocode

BEGIN

Read array

sum $\leftarrow$ 0

FOR each starting index

 Create empty set

 FOR each ending index

 Insert current element into set

 distinct $\leftarrow$ size of set

sum ← sum + (distinct × distinct)

ENDFOR

ENDFOR

PRINT sum

END

main.py	   Share  Run	Output  Clear
<pre>1 nums = list(map(int, input("Enter array: ").split())) 2 3 total = 0 4 5 for i in range(len(nums)): 6 s = set() 7 for j in range(i, len(nums)): 8 s.add(nums[j]) 9 total += len(s) ** 2 10 11 print(total)</pre>	Enter array: 1 2 1 15 === Code Execution Successful ===	

Sample Input

1 2 1

Sample Output

15

Time Complexity

$O(n^2)$

Space Complexity

$O(n)$

Result

Thus, the program was executed successfully and the required sum was obtained.

Experiment 4: Count Valid Pairs

Aim

To write a program to count pairs whose values are equal and whose index product is divisible by k.

Algorithm

1. **Start.**
2. **Read the array and the value of k.**
3. **Compare every pair of indices.**
4. **Check if values are equal.**
5. **Check if index product is divisible by k.**
6. **Count such pairs.**
7. **Display the count.**
8. **Stop.**

Pseudocode

BEGIN

Read array

Read k

count $\leftarrow$ 0

FOR i $\leftarrow$ 0 to n-1

FOR j $\leftarrow$ i+1 to n-1

IF array[i] = array[j]

IF (i $\times$ j) mod k = 0

 count $\leftarrow$ count + 1

ENDIF

ENDIF

ENDFOR

ENDFOR

PRINT count

END

```
1 nums = list(map(int, input("Enter array: ").split()))
2 k = int(input("Enter k: "))
3
4 count = 0
5
6 for i in range(len(nums)):
7     for j in range(i + 1, len(nums)):
8         if nums[i] == nums[j] and (i * j) % k == 0:
9             count += 1
10
11 print(count)
```

```
Enter array: 3 1 2 2 2 1 3
Enter k: 2
4
=== Code Execution Successful ===
```

Sample Input

3 1 2 2 2 1 3

2

Sample Output

4

Time Complexity

$O(n^2)$

Space Complexity

$O(1)$

Result

Thus, the program was executed successfully and the number of valid pairs was displayed.

Experiment 5: Find the Maximum Element

Aim

To write a program to find the maximum element in an array.

Algorithm

1. Start.
2. Read the array.
3. Assume the first element is maximum.
4. Compare every element with the current maximum.
5. Update the maximum if a larger element is found.
6. Display the maximum element.
7. Stop.

Pseudocode

BEGIN

Read array

maximum $\leftarrow$ first element

FOR each element

IF element > maximum

maximum ← element

ENDIF

ENDFOR

PRINT maximum

END

<pre>1 arr = list(map(int, input("Enter array: ").split())) 2 3 maximum = arr[0] 4 5 for num in arr: 6 if num > maximum: 7 maximum = num 8 9 print(maximum)</pre>	<pre>Enter array: 1 2 3 4 5 5 === Code Execution Successful ===</pre>
--	---

Sample Input

1 2 3 4 5

Sample Output

5

Time Complexity

O(n)

Space Complexity

O(1)

Result

Thus, the program was executed successfully and the maximum element in the array was displayed.

EXPERIMENT 6 – Sort the List and Find the Maximum Element

Aim

To write a Python program to sort a list using an efficient sorting algorithm and find the maximum element.

Algorithm

1. Start.
2. Read the list.
3. Check whether the list is empty.
4. If empty, display an appropriate message.
5. Otherwise, sort the list using Merge Sort.
6. Print the last element as the maximum.
7. Stop.

Pseudocode

BEGIN

Read list

IF list is empty

PRINT "List is empty"

STOP

ENDIF

Perform Merge Sort

PRINT last element

END

```
1- def merge_sort(arr):
2-     if len(arr) <= 1:
3-         return arr
4-
5-     mid = len(arr) // 2
6-
7-     left = merge_sort(arr[:mid])
8-     right = merge_sort(arr[mid:])
9-
10-    result = []
11-
12-    i = j = 0
13-
14-    while i < len(left) and j < len(right):
15-        if left[i] < right[j]:
16-            result.append(left[i])
17-            i += 1
18-        else:
19-            result.append(right[j])
20-            j += 1
21-
22-    result.extend(left[i:])
23-    result.extend(right[j:])
24-
25-    return result
26-
27-arr = [8, 3, 5, 1, 7]
28-
29-sorted_list = merge_sort(arr)
30-
31-maximum = sorted_list[-1]
32-
33-print("Sorted List: ", sorted_list)
34-print("Maximum: ", maximum)
35-
36-=== Code Execution Successful ===
```

Sample Input

[8, 3, 5, 1, 7]

Sample Output

Sorted List: [1, 3, 5, 7, 8]

Maximum: 8

Time Complexity

$O(n \log n)$

Space Complexity

$O(n)$

Result

Thus, the Python program to sort a list and find the maximum element was executed successfully.

EXPERIMENT 7 – Find Unique Elements in a List

Aim

To write a Python program to create a new list containing only the unique elements from a given list.

Algorithm

1. Start.
2. Read the list.
3. Create an empty set and an empty result list.
4. Traverse every element.
5. If the element is not present in the set, insert it into both the set and the result list.
6. Display the result list.
7. Stop.

Pseudocode

BEGIN

Read list

Create empty set

Create empty result list

FOR each element

IF element not in set

Add element to set

Add element to result list

ENDIF

ENDFOR

PRINT result list

END

```
1- def unique_elements(nums):
2-     seen = set()
3-     result = []
4-
5-     for num in nums:
6-         if num not in seen:
7-             seen.add(num)
8-             result.append(num)
9-
10-    return result
11
12
13 nums = [3, 7, 3, 5, 2, 5, 9, 2]
14
15 print(unique_elements(nums))
```

[3, 7, 5, 2, 9]

=== Code Execution Successful ===

Sample Input

[3, 7, 3, 5, 2, 5, 9, 2]

Sample Output

[3, 7, 5, 2, 9]

Time Complexity

$O(n)$

Space Complexity

$O(n)$

Result

Thus, the Python program to obtain unique elements from a list was executed successfully.

EXPERIMENT 8 – Bubble Sort

Aim

To write a Python program to sort an array of integers using the Bubble Sort technique.

Algorithm

1. Start.
2. Read the array.
3. Compare adjacent elements.
4. Swap them if they are in the wrong order.
5. Repeat until the array becomes sorted.
6. Display the sorted array.
7. Stop.

Pseudocode

BEGIN

Read array

FOR $i \leftarrow 0$ **to** $n-2$

FOR $j \leftarrow 0$ **to** $n-i-2$

IF $\text{array}[j] > \text{array}[j+1]$

 Swap $\text{array}[j]$ and $\text{array}[j+1]$

ENDIF

ENDFOR

ENDFOR

PRINT sorted array

END

main.py	Run	Output
<pre>1- def bubble_sort(arr): 2- n = len(arr) 3- 4- for i in range(n - 1): 5- swapped = False 6- 7- for j in range(n - i - 1): 8- if arr[j] > arr[j + 1]: 9- arr[j], arr[j + 1] = arr[j + 1], arr[j] 10- swapped = True 11- 12- if not swapped: 13- break 14- 15- return arr</pre>		Sorted Array: [11, 12, 22, 25, 34, 64, 90] === Code Execution Successful === 

Sample Input

[64, 34, 25, 12, 22, 11, 90]

Sample Output

Sorted Array: [11, 12, 22, 25, 34, 64, 90]

Time Complexity

- Best Case: $O(n)$
- Average Case: $O(n^2)$
- Worst Case: $O(n^2)$

Space Complexity

$O(1)$

Result

Thus, the Python program to sort an array using the Bubble Sort technique was executed successfully and the expected output was obtained.

EXPERIMENT 9 – Binary Search

Aim

To write a Python program to search for a given element in a sorted array using the Binary Search technique.

Algorithm

1. Start.
2. Read the sorted array and the key.
3. Initialize $low = 0$ and $high = n - 1$.
4. Find the middle element.
5. If the middle element equals the key, display its position.
6. If the key is smaller, search the left half.
7. Otherwise, search the right half.
8. Repeat until the element is found or the search space becomes empty.
9. Stop.

Pseudocode

BEGIN

Read sorted array

Read key

$low \leftarrow 0$

high $\leftarrow$ **n** - 1

WHILE **low** $\leq$ **high**

mid $\leftarrow$ (**low** + **high**) // 2

IF **array**[**mid**] = **key**

PRINT **position**

STOP

ELSE IF **key** < **array**[**mid**]

high $\leftarrow$ **mid** - 1

ELSE

low $\leftarrow$ **mid** + 1

ENDIF

ENDWHILE

PRINT "Element not found"

END

main.py	   Share	Run	Output	Clear
<pre>1 def binary_search(arr, key): 2 arr.sort() 3 4 low = 0 5 high = len(arr) - 1 6 7 while low <= high: 8 mid = (low + high) // 2 9 10 if arr[mid] == key: 11 return mid 12 13 elif arr[mid] < key: 14 low = mid + 1 15 16 else: 17 high = mid - 1</pre>			Sorted Array: [-9, 3, 4, 6, 8, 9, 10, 30] Element found at position 7 === Code Execution Successful ===	

Sample Input

Array = [3,4,6,-9,10,8,9,30]

Key = 10

Sample Output

Sorted Array: [-9,3,4,6,8,9,10,30]

Element found at position 7

Time Complexity

Best Case: $O(1)$

Average Case: $O(\log n)$

Worst Case: $O(\log n)$

Space Complexity

$O(1)$

Result

Thus, the program for Binary Search was executed successfully.

EXPERIMENT 10 – Merge Sort

Aim

To write a Python program to sort an array using Merge Sort without using any built-in sorting functions.

Algorithm

1. Start.
2. Divide the array into two halves.
3. Recursively sort both halves.
4. Merge the sorted halves.
5. Repeat until the array becomes completely sorted.
6. Display the sorted array.
7. Stop.

Pseudocode

BEGIN

Read array

IF $\text{size} \leq 1$

 RETURN

Divide array

Sort left half

Sort right half

Merge both halves

PRINT sorted array

END

```
main.py [Icons] [Share] [Run] Output [Clear]
1 def merge_sort(arr):
2
3     if len(arr) > 1:
4
5         mid = len(arr)//2
6
7         left = arr[:mid]
8
9         right = arr[mid:]
10
11        merge_sort(left)
12        merge_sort(right)
13
14        i = j = k = 0
15
16        while i < len(left) and j < len(right):
```

[1, 2, 3, 5]

=== Code Execution Successful ===

Sample Input

[5,2,3,1]

Sample Output

[1,2,3,5]

Time Complexity

Best Case: $O(n \log n)$

Average Case: $O(n \log n)$

Worst Case: $O(n \log n)$

Space Complexity

$O(n)$

Result

Thus, the Merge Sort program was executed successfully.

EXPERIMENT 11 – Out of Boundary Paths

Aim

To write a Python program to find the number of ways a ball can move out of a grid boundary in exactly N moves.

Algorithm

1. Start.
2. Read m, n, N, starting row and starting column.
3. Initialize a DP table.
4. For every move, calculate paths in all four directions.
5. Count paths moving outside the grid.
6. Repeat until N moves.
7. Print the total number of paths.
8. Stop.

Pseudocode

BEGIN

Read m,n,N,row,column

Initialize DP table

FOR each move

 Calculate paths in four directions

 Store results

ENDFOR

PRINT total paths

END

```
main.py  [Icons]  Share  Run  Output  Clear
1 from functools import lru_cache
2
3 def findPaths(m, n, N, row, col):
4
5     @lru_cache(None)
6     def dp(i, j, moves):
7
8         if i < 0 or i >= m or j < 0 or j >= n:
9             return 1
10
11         if moves == 0:
12             return 0
13
14         return (dp(i+1,j,moves-1) +
15                 dp(i-1,j,moves-1) +
16                 dp(i,j+1,moves-1) +
```

6

=== Code Execution Successful ===

Sample Input

m = 2

n = 2

N = 2

row = 0

column = 0

Sample Output

6

Time Complexity

$O(m \times n \times N)$

Space Complexity

$O(m \times n \times N)$

Result

Thus, the program for finding out-of-boundary paths was executed successfully.

EXPERIMENT 12 – House Robber II

Aim

To write a Python program to determine the maximum amount of money that can be robbed from circularly arranged houses without robbing adjacent houses.

Algorithm

1. Start.

2. Read the money in each house.
3. Exclude the first house and solve.
4. Exclude the last house and solve.
5. Take the maximum of both values.
6. Print the answer.
7. Stop.

Pseudocode

BEGIN

Read houses

IF only one house

PRINT amount

ELSE

Solve excluding first house

Solve excluding last house

PRINT maximum value

ENDIF

END

```
1- def rob_linear(nums):
2
3     prev = curr = 0
4
5-     for money in nums:
6
7         prev, curr = curr, max(curr, prev + money)
8
9     return curr
10
11
12- def rob(nums):
13
14-     if len(nums) == 1:
15
16         return nums[0]
```

3

=== Code Execution Successful ===

Sample Input

[2,3,2]

Sample Output

3

Time Complexity

$O(n)$

Space Complexity

$O(1)$

Result

Thus, the House Robber II program was executed successfully.

EXPERIMENT 13 – Climbing Stairs

Aim

To write a Python program to find the number of distinct ways to climb a staircase when a person can climb either 1 or 2 steps at a time.

Algorithm

1. Start.
2. Read the number of stairs n .
3. If n is 1 or 2, return n .
4. Initialize two variables for the first two staircase counts.
5. Compute the remaining values using dynamic programming.
6. Display the total number of ways.
7. Stop.

Pseudocode

BEGIN

Read n

IF $n = 1$

PRINT 1

ELSE IF $n = 2$

PRINT 2

ELSE

first $\leftarrow 1$

second $\leftarrow 2$

FOR i ← 3 TO n

third ← first + second

first ← second

second ← third

ENDFOR

PRINT second

ENDIF

END

main.py	   Share	Run	Output	Clear
<pre>1- def climbStairs(n): 2 3- if n <= 2: 4 return n 5 6 first = 1 7 second = 2 8 9- for i in range(3, n + 1): 10 first, second = second, first + second 11 12 return second 13 14 15 print(climbStairs(4))</pre>			5 === Code Execution Successful ===	

Sample Input

4

Sample Output

5

Time Complexity

O(n)

Space Complexity

O(1)

Result

Thus, the Python program to find the number of distinct ways to climb stairs was executed successfully.

EXPERIMENT 14 – Unique Paths

Aim

To write a Python program to find the number of unique paths from the top-left corner to the bottom-right corner of a grid.

Algorithm

1. Start.
2. Read the values of m and n.
3. Create a DP table.
4. Fill the first row and first column with 1.
5. Fill the remaining cells using the sum of the top and left cells.
6. Display the final value.
7. Stop.

Pseudocode

BEGIN

Read m,n

Create DP table

Fill first row with 1

Fill first column with 1

FOR each remaining cell

cell = top + left

ENDFOR

PRINT last cell

END

main.py	Output
<pre>1- def uniquePaths(m, n): 2 3 dp = [[1] * n for i in range(m)] 4 5 for i in range(1, m): 6 for j in range(1, n): 7 dp[i][j] = dp[i-1][j] + dp[i][j-1] 8 9 return dp[m-1][n-1] 10 11 12 print(uniquePaths(7,3))</pre>	<pre>28 === Code Execution Successful ===</pre>

Sample Input

7 3

Sample Output

28

Time Complexity

$O(m \times n)$

Space Complexity

$O(m \times n)$

Result

Thus, the Python program to find the number of unique paths was executed successfully.

EXPERIMENT 15 – Large Group Positions

Aim

To write a Python program to find the starting and ending indices of every large group in a string.

Algorithm

1. Start.
2. Read the string.
3. Traverse the string.
4. Count consecutive identical characters.
5. If a group length is at least 3, store its start and end indices.
6. Display all large groups.
7. Stop.

Pseudocode

BEGIN

Read string

start $\leftarrow$ 0

FOR each character

IF character changes

IF group length ≥ 3

PRINT interval

ENDIF

Update start

ENDIF

ENDFOR

Check last group

END

```
1 - def largeGroupPositions(s):
2
3     ans = []
4
5     start = 0
6
7     for i in range(1, len(s)+1):
8

EXPERIMENT 16 – Game of Life

Aim

To write a Python program to generate the next state of Conway's Game of Life.

Algorithm

1. Start.
2. Read the board.
3. Count the live neighbours of every cell.
4. Apply the four Game of Life rules.
5. Update every cell simultaneously.
6. Display the next generation.
7. Stop.

Pseudocode

BEGIN

Read board

FOR each cell

Count live neighbours

Apply Game of Life rules

ENDFOR

Update board

PRINT board

END

The screenshot shows a Python IDE with a file named 'main.py'. The code defines a function 'gameOfLife(board)' that calculates the next state of a Conway's Game of Life board. It uses a list of directions to count live neighbors for each cell. The output window shows the next state of the board as a 4x4 grid: [[0, 0, 0], [1, 0, 1], [0, 1, 1], [0, 1, 0]]. Below the output, it says '=== Code Execution Successful ==='.

```
1- def gameOfLife(board):
2
3     rows = len(board)
4     cols = len(board[0])
5
6     directions = [(-1,-1),(-1,0),(-1,1),
7                   (0,-1),(0,1),
8                   (1,-1),(1,0),(1,1)]
9
10    copy = [row[:] for row in board]
11
12    for i in range(rows):
13        for j in range(cols):
14
15            live = 0
16
17            for dx,dy in directions:
```

[[0, 0, 0], [1, 0, 1], [0, 1, 1], [0, 1, 0]]

=== Code Execution Successful ===

Sample Input

[[0,1,0],[0,0,1],[1,1,1],[0,0,0]]

Sample Output

[[0,0,0],[1,0,1],[0,1,1],[0,1,0]]

Time Complexity

$O(m \times n)$

Space Complexity

$O(m \times n)$

Result

Thus, the Python program for Conway's Game of Life was executed successfully.

EXPERIMENT 17 – Champagne Tower

Aim

To write a Python program to determine the amount of champagne in a specified glass after pouring a given number of cups.

Algorithm

1. Start.
2. Read the poured amount, query row, and query glass.
3. Create a DP table.
4. Pour champagne into the first glass.
5. Distribute overflow equally to the next row.
6. Repeat until the required row is reached.
7. Display the amount in the required glass.
8. Stop.

Pseudocode

BEGIN

Read poured,row,glass

Create DP table

Pour champagne

FOR each row

IF overflow exists

Divide equally

Add to left and right glasses

ENDIF

ENDFOR

PRINT requested glass

END

main.py

Share

Run

Output

Clear

```
1 def champagneTower(poured, query_row, query_glass):
2
3     dp = [[0.0]*101 for i in range(101)]
4
5     dp[0][0] = poured
6
7     for r in range(query_row+1):
8
9         for c in range(r+1):
10
11             overflow = (dp[r][c]-1)/2
12
13             if overflow > 0:
14
15                 dp[r+1][c] += overflow
16
17                 dp[r+1][c+1] += overflow
```

0.5
=== Code Execution Successful ===

Sample Input

2

1

1

Sample Output

0.5

Time Complexity

$O(\text{query_row}^2)$

Space Complexity

$O(\text{query_row}^2)$

Result

Thus, the Python program to simulate the Champagne Tower problem was executed successfully.
